medicinal plants supply the ever growing needs of humankind for natural chemicals such as pharmaceuticals nutraceuticals  
 agrochemicals and chemical additives these plants contain bioactive secondary metabolites which possess antimalarial anthelmintic  
 anti inflammatory analgesic antimicrobial antiarthritic antioxidant antidiabetic antihypertensive anticancer antifungal antispasmodic  
 cardioprotective antithyroid and antihistaminic properties secondary metabolites play a major role in the adaptation of plants to the  
 changing environment and stress condition as they are affected by both biotic and abiotic stress humans rely on medicinal plants for  
 various needs since ancient time and their population still seems enough for fulfilling our demands however in the foreseeable future  
 we will be forced to think about the accessibility of resources for future generations for these reasons we must look for alternative  
 sustainable options of resources which can protect these immensely important medicinal plants from various stresses induced by  
 challenging environment evolving eco friendly methodologies and mechanisms to improve these plants responses to unfavorable

environmental circumstances is important in creating significant tools for better understanding of plant adaptations to various abiotic stresses and sustaining the supply of pharmaceuticals as global climate change intensifies one of the great challenges in the near future will be the sustainable production of medicinal plants under increasing adverse effects of climate change a combination of adverse demographic factors and climatological perturbations is expected to impact food and pharmaceutical production globally despite the induction of several tolerance mechanisms medicinal plants often fail to survive under environmental extremes to ensure their sustainable production under adverse conditions multidisciplinary approaches are needed and useful leads are likely to emerge however improving plants performance under restrictive growth conditions requires a deep understanding of the molecular processes that underlie their extraordinary physiological plasticity this edited volume emphasizes the recent updates about the current research on medicinal plants covering different aspects related to challenges and opportunities in the concerned field this book is an attempt to bring together global researchers who have been engaged in the area of stress signaling crosstalk and mechanisms of medicinal plants the book will provide a direction towards implementation of programs and practices that will enable sustainable production of medicinal plants resilient to challenging environmental conditions moreover this book will instigate and commence readers to state of the art developments and trends in this field
